	1x Ledning med 3 ledere*	https://goo.gl/MU5rit eller lignende

Hvor som helst

1x 1K-Motstand e.l.

ELDRE TEGNING AV SYSTEM

PROBLEMER

- Fukt

- Knapp
 - Har foreløpig blitt løst ved å gradvis øke debounce
- Temperatursensor
 - Har opplevd mistenkelig høye temperaturer en ca. måned etter installasjon
 - Skal byttes til vannsikker pt100 (om jeg husker rett)

Monterings- og sammensetningstid

- System og montering bør strømlinjeformes
 - Kretsen skal designes til ett kretskort med intuitiv I/O
 - Krets og rørsystem skal integreres til ett
 - Skal være ferdig koblet før montering

- Overgang mellom spenninger

- o Bruker foreløpig hjemmesnekret overgang mellom spenninger
 - Ønsker å utbedre løsning dersom det finnes åpenbart bedre løsninger.

- Strømforbruk

- Ingen oversikt over effekt
 - Må forbedres hvis overgang til batteri eller vannkraft som strømtilførsel

Knotete kode

- Skyldes at vi er ferske
 - Skal skrives på nytt med leselighet og redigerbarhet i fokus

PLANER/IDÉER

- Gjøre system robust
- Gjøre system enkelt å reparere for en gjennomsnittlig elektriker/rørlegger
- Intuitiv fjernstyring av fontener (justere enkle parametere og skru av og på)
- Automatiske feilmeldinger
- Automatiske software-fixes (f.eks. ved åpenbar støy i knapp og temperatur)
- Vann som strømtilførsel
- Touchknapp (med hardware fra f.eks. Microchip, men krever mye utvikling), se siste del av dokument.
- Automatisert analyse og fremstilling av data
- API for kunder som ønsker å behandle tall selv
